

My Way

Even though SolarVu can generate flexible reports for any time period, sometimes customers want to access their data for analysis their way. Included in a SurePoint subscription, is an API to allow live and lifetime data retrieval from the SolarVu cloud servers by a customer owned server. Use it to automatically transfer performance data to an asset management system, do spreadsheet performance analysis, show live output updates on a website or for unique uses. Have your web developer or programmer [contact Cachelan](#) for the API documentation and technical support to implement your ideas.

Solar bond investors can check live output from their investments at solarbonds.ca

Automatically transfer data to a remote server for integration into another program or spreadsheet analysis.
